Sample Question 1: Maxima and Minima of Functions of Two Variables

Question:

Find the critical points and determine their nature for the function $(f(x, y) = 3x^2 + 2xy + y^2 - 6x - 4y + 5)$.

Answer:

Step 1: Find the first-order partial derivatives

$\{$

$$\frac{\partial f}{\partial x} = 6x + 2y - 6$$

$\}$

$\{$

$$\frac{\partial f}{\partial y} = 2x + 2y - 4$$

$\}$

Step 2: Set partial derivatives to zero to find critical points

$\{$

$$6x + 2y - 6 = 0 \quad \dots(1)$$

$\}$

$\{$

$$2x + 2y - 4 = 0 \quad \dots(2)$$

$\}$

Step 3: Solve the equations

From (2):

$\{$

$$2x + 2y = 4 \Rightarrow x + y = 2 \Rightarrow y = 2 - x$$

\]

Substitute into (1):

\[

$$6x + 2(2 - x) - 6 = 0$$

\]

\[

$$6x + 4 - 2x - 6 = 0$$

\]

\[

$$(6x - 2x) + (4 - 6) = 0$$

\]

\[

$$4x - 2 = 0$$

\]

\[

$$4x = 2 \Rightarrow x = \frac{1}{2}$$

\]

Now, find y:

\[

$$y = 2 - x = 2 - \frac{1}{2} = \frac{3}{2}$$

\]

Critical point: $\left(\frac{1}{2}, \frac{3}{2}\right)$

Step 4: Second derivative test

Calculate second partial derivatives:

[

$$f_{xx} = 6, \quad f_{yy} = 2, \quad f_{xy} = 2$$

]

Determinant D:

[

$$D = f_{xx} f_{yy} - (f_{xy})^2 = (6)(2) - (2)^2 = 12 - 4 = 8 > 0$$

]

Since $(D > 0)$ and $(f_{xx} > 0)$, the critical point is a local minimum.

Sample Question 2: Solving a First-Order Differential Equation

Question:

Solve the differential equation:

[

$$\frac{dy}{dx} = \frac{x + y}{x}$$

]

given that $(y(1) = 2)$.

Answer:

Step 1: Rewrite the differential equation

[

$$\frac{dy}{dx} = 1 + \frac{y}{x}$$

\\

This is a linear differential equation in the form:

\\

$$\frac{dy}{dx} - \frac{1}{x} y = 1$$

\\

Step 2: Find the integrating factor

\\

$$\mu(x) = e^{-\int \frac{1}{x} dx} = e^{-\ln |x|} = \frac{1}{x}$$

\\

Step 3: Multiply the entire equation by the integrating factor

\\

$$\frac{1}{x} \frac{dy}{dx} - \frac{1}{x^2} y = \frac{1}{x}$$

\\

Recognize the left as the derivative of $\left(\frac{y}{x} \right)$:

\\

$$\frac{d}{dx} \left(\frac{y}{x} \right) = \frac{1}{x}$$

\\

Step 4: Integrate both sides

\\

$$\frac{y}{x} = \int \frac{1}{x} dx = \ln |x| + C$$

$$\]$$

Step 5: Solve for y

$$\[$$

$$y = x (\ln |x| + C)$$

$$\]$$

Step 6: Apply the initial condition $y(1) = 2$

$$\[$$

$$2 = 1 (\ln 1 + C) = 0 + C \Rightarrow C = 2$$

$$\]$$

Final solution:

$$\[$$

$$\boxed{\}$$

$$y = x (\ln |x| + 2)$$

$$\}$$

$$\]$$

Sample Question 3: Evaluation of a Double Integral over a Region

Question:

Evaluate the double integral:

$$\[$$

$$\iint_R xy \, dA$$

$$\]$$

where (R) is the region bounded by $(x = 0)$, $(y = 0)$, and $(y = 4 - x)$.

Answer:

Step 1: Describe the region (R)

- (x) ranges from 0 to 4 (since $(y = 4 - x)$ intersects $(x=0)$ and $(y=0)$)
- For each (x) , (y) ranges from 0 to $(4 - x)$

Step 2: Set up the double integral

$$\int_0^4 \int_0^{4-x} xy \, dy \, dx$$

Step 3: Integrate with respect to (y)

$$\int_0^4 \left[x \frac{y^2}{2} \right]_0^{4-x} dx = \int_0^4 x \frac{(4-x)^2}{2} dx$$

Step 4: Simplify and integrate with respect to (x)

$$\frac{1}{2} \int_0^4 x (4-x)^2 dx$$

Expand $(4-x)^2 = 16 - 8x + x^2$:

$$\frac{1}{2} \int_0^4 x (16 - 8x + x^2) dx$$

Distribute:

\[

$$\frac{1}{2} \int_0^4 (16x - 8x^2 + x^3) dx$$

\]

Integrate term by term:

\[

$$\frac{1}{2} \left[8x^2 - \frac{8}{3} x^3 + \frac{1}{4} x^4 \right]_{$$

The focus of this article is to analyze a typical problem involving differential equations, a core component of Diploma Mathematics 2, illustrating the approach required to arrive at solutions systematically.

Sample Problem: Solving a Second-Order Differential Equation

Problem Statement

Solve the second-order linear differential equation:

$$\frac{d^2 y}{dx^2} - 3 \frac{dy}{dx} + 2 y = 0$$

with initial conditions:

$$y(0) = 4, \quad y'(0) = 0$$

Determine the general solution, apply the initial conditions, and find the particular solution.

Step-by-Step Solution Approach

1. Recognize the Type of Differential Equation

The given equation is a homogeneous linear second-order differential equation with constant coefficients:

$$\frac{d^2 y}{dx^2} - 3 \frac{dy}{dx} + 2 y = 0$$

\]

The standard method for such equations involves solving the characteristic (auxiliary) equation derived from the differential equation.

2. Formulate the Characteristic Equation

Assume a solution of the form $y = e^{mx}$, where m is a constant to be determined. Substituting into the differential equation:

\[

$$m^2 e^{mx} - 3m e^{mx} + 2 e^{mx} = 0$$

\]

Dividing through by e^{mx} (which is never zero):

\[

$$m^2 - 3m + 2 = 0$$

\]

This quadratic equation is the characteristic equation.

3. Solve the Characteristic Equation

Solve:

\[

$$m^2 - 3m + 2 = 0$$

\]

Factor or use quadratic formula:

\[

$$(m - 1)(m - 2) = 0$$

$$\backslash]$$

Thus,

$$\backslash[$$

$$m_1 = 1, \quad m_2 = 2$$

$$\backslash]$$

Since roots are real and distinct, the general solution of the differential equation is:

$$\backslash[$$

$$y(x) = C_1 e^{m_1 x} + C_2 e^{m_2 x} = C_1 e^x + C_2 e^{2x}$$

$$\backslash]$$

where (C_1) and (C_2) are constants to be determined.

4. Apply Initial Conditions to Find Constants

Given:

$$\backslash[$$

$$y(0) = 4, \quad y'(0) = 0$$

$$\backslash]$$

Compute $(y(0))$:

$$\backslash[$$

$$y(0) = C_1 e^{\{0\}} + C_2 e^{\{0\}} = C_1 + C_2 = 4$$

$$\backslash]$$

Next, compute $(y'(x))$:

$$\backslash[$$

$$y'(x) = C_1 e^x + 2 C_2 e^{2x}$$

\]

Apply the initial condition \(\ y'(0) = 0 \ \):

\[

$$C_1 e^0 + 2 C_2 e^0 = C_1 + 2 C_2 = 0$$

\]

Now, we have a system of two equations:

\[

\begin{cases}

$$C_1 + C_2 = 4 \ \backslash \$$

$$C_1 + 2 C_2 = 0$$

\end{cases}

\]

Subtract the first from the second:

\[

$$(C_1 + 2 C_2) - (C_1 + C_2) = 0 - 4$$

\]

\[

$$C_2 = -4$$

\]

Substitute \(\ C_2 = -4 \ \) into the first equation:

$$\setminus[$$

$$C_1 - 4 = 4 \Rightarrow C_1 = 8$$

$$\setminus]$$

5. Write the Particular Solution

Plugging the constants back into the general solution:

$$\setminus[$$

$$\boxed{\setminus[$$

$$y(x) = 8 e^x - 4 e^{2x}$$

$$\setminus]$$

$$\setminus]$$

This is the particular solution satisfying the initial conditions.
